

WHAT IS CLAIMED IS:

1. A device for compressing the chest of a patient comprising:
a band adapted to extend around the chest of the patient;
a driver mechanism, operably connected to the band, for
circumferentially contracting the band;
5 a fluid-filled cushion disposed between the chest of the
patient and the band; and
an automatic controller for controlling operation of the
driver mechanism.
- 10 2. A device for compressing the chest of a patient comprising:
a band adapted to extend around the chest of the patient, the
band having a length and a plurality of fluid-receiving
cells disposed along the length of the band;
a driver mechanism, operably connected to the band, for
inflating the fluid-receiving cells;
15 a cushion disposed between the chest of the patient and the
band; and
an automatic controller for controlling operation of the
driver mechanism.
- 20 3. The device of claim 2, wherein the cushion is a sealed
cushion.
4. The device of claim 2, wherein the band is comprised of an
inelastic material.
5. A device for compressing the chest of a patient comprising:
25 a band adapted to extend around the chest of the patient, the
band having a length and a plurality of fluid-receiving
cells disposed along the length of the band, wherein the

plurality of fluid-receiving cells are in fluid communication with each other;

a driver mechanism, connected to the band and the fluid-receiving cells, for inflating the fluid-receiving cells;

5 a cushion disposed between the chest of the patient and the band; and

an automatic controller for controlling the operation of the driver mechanism.

6. The device of claim 5, wherein the cushion is a sealed cushion.

10 7. The device of claim 5, wherein the band is comprised of an inelastic material.

8. A device for compressing the chest of a patient comprising:

15 a band adapted to extend around the chest of the patient, the band having a length and a plurality of fluid-receiving cells disposed along the length of the band, each fluid-receiving cells being interconnected to another fluid-receiving cells by a linking portion;

20 a driver mechanism, operably connected to the band, for inflating the fluid-receiving cells;

a cushion disposed between the chest of the patient and the band; and

an automatic controller for controlling operation of the driver mechanism.

25 9. The device of claim 8, wherein the cushion is a sealed cushion.

10. The device of claim 8, wherein the band is comprised of an inelastic material.

11. A device for compressing the chest of a patient comprising:

a band adapted to extend around the chest of the patient, the
band having a length and a plurality of fluid-receiving
cells disposed along the length of the band, each fluid-
receiving cells being interconnected to another fluid-
receiving cell by a linking portion, wherein the plurality
of fluid-receiving cells are in fluid communication with
each other;

5

a driver mechanism, connected to the band and the fluid-
receiving cells, for inflating the fluid-receiving cells;

10

a cushion disposed between the chest of the patient and the
band; and

an automatic controller for controlling the operation of the
driver mechanism.

12. The device of claim 11, wherein the cushion is a sealed
cushion.

13. The device of claim 11, wherein the band is comprised of an
inelastic material.
